

# Coalescing-fragmentating Wasserstein dynamics: particle approach

Vitalii Konarovskiy

Bielefeld University

DMV Annual Meeting 2022 — Berlin

# Table of Contents

- 1 Motivation: coalescing particle systems
- 2 Sticky-reflected particle system
- 3 Number of particles

# Coalescing particle system: Arratia flow

## Arratia flow on $\mathbb{R}$ (R. Arratia '79)

- Brownian particles start from every point of an interval;
- they move independently and coalesce after meeting;

# Mathematical description of Arratia flow

$X(u, t)$  is the position of particle at time  $t$  starting at  $u$

- ①  $X(u, 0) = u$ ;
- ②  $X(u, \cdot)$  is a Brownian motion in  $\mathbb{R}$ ;
- ③  $X(u, t) \leq X(v, t)$ ,  $u < v$
- ④  $\langle X(u, \cdot), X(v, \cdot) \rangle_t = \int_0^t \mathbb{I}_{\{X(u,s)=X(v,s)\}} ds$ .

# Arratia flow and its generalization

- **Arratia flow appears as scaling limit of different models**

- true self-repelling motion (B.Tóth and W. Werner (PTRF '98))
- isotropic stochastic flows of homeomorphisms in  $\mathbb{R}$  (V. Piterbarg (Ann. Prob. '98))
- Hastings-Levitov planer aggregation models (J. Norris, A. Turner (Comm. Math. Phys. '12)), etc...

- **Further investigation of the Arratia flow**

- Properties of generated  $\sigma$ -algebra (B. Tsirelson (Probab. Surv. '04))
- $n$ -particle motion (R. Tribe, O.V. Zaboronski (EJP '04, Comm. Math. Phys. '06))
- large deviations (A. Dorogovtsev, O. Ostapenko (Stoch. Dyn. '10)), etc...

- **Generalizations**

- Brownian web (C. M. Newman et al. (Ann. Prob. '04), R. Sun, J.M Swart (MAMS, '14))
- Coalescing non-Brownian particles (S. Evans et al. (PTRF, '13))
- Stochastic flows of kernels (Y. Le Jan and O. Raimond (Ann. Prob. '04))

# Modified Massive Arratia flow

## Modified massive Arratia flow on $\mathbb{R}$ (K. '17)

- Brownian particles start from points **with masses**;
- they move independently and coalesce after meeting;
- **particles sum their masses after meeting** and diffusion rate is **inversely proportional to the mass**.

# Mathematical description

$Y(u, t)$  is the position of particle at time  $t$  labeled by  $u \in (0, 1)$

- ①  $Y(u, 0) = u$ ;
- ②  $Y(u, \cdot)$  is a **continuous martingale**;
- ③  $Y(u, t) \leq Y(v, t)$ ,  $u < v$ ;
- ④  $\langle Y(u, \cdot), Y(v, \cdot) \rangle_t = \int_0^t \frac{\mathbb{I}_{\{Y(u,s)=Y(v,s)\}}}{m(u,s)} ds$ ,  
 $m(u, s) = \text{Leb}\{w : Y(w, s) = Y(u, s)\}$ .

# Short-time asymptotic of a Brownian motion

Short-time asymptotic formula for a heat kernel

$$p(t, x, y) = \frac{1}{(2\pi t)^{n/2}} e^{-\frac{\|x-y\|^2}{2t}} \sim e^{-\frac{\|x-y\|^2}{2t}}, \quad t \rightarrow 0+.$$

# Short-time asymptotic of a Brownian motion

Short-time asymptotic formula for a heat kernel

$$p(t, x, y) = \frac{1}{(2\pi t)^{n/2}} e^{-\frac{\|x-y\|^2}{2t}} \sim e^{-\frac{\|x-y\|^2}{2t}}, \quad t \rightarrow 0+.$$

## Generalizations

- Heat equation with variable coefficients in  $\mathbb{R}^n$  (Varadhan (CPAM '67))
- Smooth Riemannian manifold with Ricci curvature bound  
(P. Li and S.-T. Yau (Acta Math. '86))
- Lipschitz Riemannian manifold without any sort of curvature bounds  
(J. Norris (Acta Math. 97))
- Infinite-dimensional case for heat kernel generated by a Dirichlet form  
(J. Ramírez (CPAM '01, Ann. Prob '03))

# Short-time asymptotic of a Brownian motion

Short-time asymptotic formula for a heat kernel

$$p(t, x, y) = \frac{1}{(2\pi t)^{n/2}} e^{-\frac{\|x-y\|^2}{2t}} \sim e^{-\frac{\|x-y\|^2}{2t}}, \quad t \rightarrow 0+.$$

## Generalizations

- Heat equation with variable coefficients in  $\mathbb{R}^n$  (Varadhan (CPAM '67))
- Smooth Riemannian manifold with Ricci curvature bound (P. Li and S.-T. Yau (Acta Math. '86))
- Lipschitz Riemannian manifold without any sort of curvature bounds (J. Norris (Acta Math. 97))
- Infinite-dimensional case for heat kernel generated by a Dirichlet form (J. Ramírez (CPAM '01, Ann. Prob '03))

## Corollary

If  $B_t$ ,  $t \geq 0$ , is a Brownian motion on a Riemannian manifold, then

$$\mathbb{P}_x \{B_t = y\} \sim e^{-\frac{d^2(x,y)}{2t}}, \quad t \rightarrow 0+,$$

with  $d$  being the Riemannian distance.

# Connection with optimal transport

## Theorem (K./ Renesse, '19)

The process  $\mu_t = Y(\cdot, t)|_{\#} \text{Leb}$ ,  $t \geq 0$ , which describes the evolution of particle masses in the modified massive Arratia flow satisfies Varadhan's formula

$$\mathbb{P}\{\mu_t = \nu\} \sim e^{-\frac{d_{\mathcal{W}}^2(\mu_0, \nu)}{2t}}, \quad t \rightarrow 0+,$$

with the quadratic Wasserstein distance  $d_{\mathcal{W}}$  in  $\mathbb{R}$ .

Quadratic Wasserstein distance:

$$d_{\mathcal{W}}(\nu_1, \nu_2) = \inf_{\xi_1 \sim \nu_1, \xi_2 \sim \nu_2} \left( \mathbb{E}|\xi_1 - \xi_2|^2 \right)^{\frac{1}{2}}$$

# Connection with optimal transport

## Theorem (K./ Renesse, '19)

The process  $\mu_t = Y(\cdot, t)|_{\#} \text{Leb}$ ,  $t \geq 0$ , which describes the evolution of particle masses in the modified massive Arratia flow satisfies Varadhan's formula

$$\mathbb{P}\{\mu_t = \nu\} \sim e^{-\frac{d_{\mathcal{W}}^2(\mu_0, \nu)}{2t}}, \quad t \rightarrow 0+,$$

with the quadratic Wasserstein distance  $d_{\mathcal{W}}$  in  $\mathbb{R}$ .

Quadratic Wasserstein distance:

$$d_{\mathcal{W}}(\nu_1, \nu_2) = \inf_{\xi_1 \sim \nu_1, \xi_2 \sim \nu_2} \left( \mathbb{E}|\xi_1 - \xi_2|^2 \right)^{\frac{1}{2}}$$

$(\mathcal{P}_2(\mathbb{R}), d_{\mathcal{W}})$  has an inf.-dim. Riemannian structure (F. Otto (JFA, '01)).

# Table of Contents

- 1 Motivation: coalescing particle systems
- 2 Sticky-reflected particle system**
- 3 Number of particles

# Sticky-reflected interaction

**Can we replace the coalescing by another type of interaction to have the same Varadhan formula and get a dynamics which is reversible in time?**

# Sticky-reflected interaction

Can we replace the coalescing by another type of interaction to have the same Varadhan formula and get a dynamics which is reversible in time?

Remind that the coalescing particle system  $X$  satisfies the following properties:

- 1  $X(u, 0) = u, u \in [0, 1]$
- 2  $X(u, \cdot)$  is a continuous martingale
- 3  $X(u, t) \leq X(v, t), u < v;$
- 4  $\langle X(u, \cdot), X(v, \cdot) \rangle_t = \int_0^t \frac{\mathbb{I}_{\{X(u,s)=X(v,s)\}}}{m(u,s)} ds,$   
 $m(u, s) = \text{Leb}\{w : X(w, t) = X(u, t)\}.$

$X(u, t)$  is the position of particle at time  $t$  started from  $u$

# Sticky-reflected interaction

Can we replace the coalescing by another type of interaction to have the same Varadhan formula and get a dynamics which is reversible in time?

Remind that the coalescing particle system  $X$  satisfies the following properties:

- 1  $X(u, 0) = g(u)$ ,  $u \in [0, 1]$ , where  $g \uparrow$ ;
- 2  $X(u, \cdot)$  is a continuous martingale
- 3  $X(u, t) \leq X(v, t)$ ,  $u < v$ ;
- 4  $\langle X(u, \cdot), X(v, \cdot) \rangle_t = \int_0^t \frac{\mathbb{I}_{\{X(u,s)=X(v,s)\}}}{m(u,s)} ds$ ,  
 $m(u, s) = \text{Leb}\{w : X(w, t) = X(u, t)\}$ .

$X(u, t)$  is the position of particle at time  $t$  started from  $g(u)$   
 (initial particle distribution =  $\text{Leb} \circ g^{-1}$ ).

# Sticky-reflected interaction

Can we replace the coalescing by another type of interaction to have the same Varadhan formula and get a dynamics which is reversible in time?

Remind that the coalescing particle system  $X$  satisfies the following properties:

- ①  $X(u, 0) = g(u)$ ,  $u \in [0, 1]$ , where  $g \uparrow$ ;
- ②  $X(u, \cdot) - \int_0^t \left( \xi(u) - \frac{1}{m(u,s)} \int_{\pi(u,s)} \xi(r) dr \right) ds$  is a continuous martingale, where  $\pi(u, t) = \{v : X(u, t) = X(v, t)\}$  and  $\xi \uparrow$  is the **interaction potential**;
- ③  $X(u, t) \leq X(v, t)$ ,  $u < v$ ;
- ④  $\langle X(u, \cdot), X(v, \cdot) \rangle_t = \int_0^t \frac{\mathbb{1}_{\{X(u,s)=X(v,s)\}}}{m(u,s)} ds$ ,  
 $m(u, s) = \text{Leb}\{w : X(w, t) = X(u, t)\}$ .

$X(u, t)$  is the position of particle at time  $t$  started from  $g(u)$   
 (initial particle distribution =  $\text{Leb} \circ g^{-1}$ ).

# Role of function $\xi$

Remind that  $X(u, \cdot) - \int_0^t \left( \xi(u) - \frac{1}{m(u,s)} \int_{\pi(u,s)} \xi(r) dr \right) ds$  is a continuous martingale, where  $\pi(u, t) = \{v : X(u, t) = X(v, t)\}$  and  $\xi \uparrow$ .

# Role of function $\xi$

Remind that  $X(u, \cdot) - \int_0^t \left( \xi(u) - \frac{1}{m(u,s)} \int_{\pi(u,s)} \xi(r) dr \right) ds$  is a continuous martingale, where  $\pi(u, t) = \{v : X(u, t) = X(v, t)\}$  and  $\xi \uparrow$ .

- If  $\xi = 0$ , then particles coalesce.

# Role of function $\xi$

Remind that  $X(u, \cdot) - \int_0^t \left( \xi(u) - \frac{1}{m(u,s)} \int_{\pi(u,s)} \xi(r) dr \right) ds$  is a continuous martingale, where  $\pi(u, t) = \{v : X(u, t) = X(v, t)\}$  and  $\xi \uparrow$ .

- If  $\xi = 0$ , then particles coalesce.
- If  $\xi$  is constant on  $\pi(u, t)$ , then the particle  $u$  has no drift.

# Role of function $\xi$

Remind that  $X(u, \cdot) - \int_0^t \left( \xi(u) - \frac{1}{m(u,s)} \int_{\pi(u,s)} \xi(r) dr \right) ds$  is a continuous martingale, where  $\pi(u, t) = \{v : X(u, t) = X(v, t)\}$  and  $\xi \uparrow$ .

- If  $\xi = 0$ , then particles coalesce.
- If  $\xi$  is constant on  $\pi(u, t)$ , then the particle  $u$  has no drift.
- If  $\xi(u) = \xi(v)$ , then particles  $u$  and  $v$  coalesce after the meeting:  
because the drifts of  $X(u, \cdot)$  and  $X(v, \cdot)$  at time  $s$  are equal after the meeting

$$\xi(u) - \frac{1}{m(u, s)} \int_{\pi(u, s)} \xi(u) du = \xi(v) - \frac{1}{m(v, s)} \int_{\pi(v, s)} \xi(r) dr,$$

since  $\pi(u, s) = \pi(v, s)$  for  $X(u, s) = X(v, s)$ .

# Role of function $\xi$

Remind that  $X(u, \cdot) - \int_0^t \left( \xi(u) - \frac{1}{m(u,s)} \int_{\pi(u,s)} \xi(r) dr \right) ds$  is a continuous martingale, where  $\pi(u, t) = \{v : X(u, t) = X(v, t)\}$  and  $\xi \uparrow$ .

- If  $\xi = 0$ , then particles coalesce.
- If  $\xi$  is constant on  $\pi(u, t)$ , then the particle  $u$  has no drift.
- If  $\xi(u) = \xi(v)$ , then particles  $u$  and  $v$  coalesce after the meeting: because the drifts of  $X(u, \cdot)$  and  $X(v, \cdot)$  at time  $s$  are equal after the meeting

$$\xi(u) - \frac{1}{m(u,s)} \int_{\pi(u,s)} \xi(u) du = \xi(v) - \frac{1}{m(v,s)} \int_{\pi(v,s)} \xi(r) dr,$$

since  $\pi(u, s) = \pi(v, s)$  for  $X(u, s) = X(v, s)$ .

$\rightsquigarrow$  If  $g(u) = g(v)$ ,  $\xi(u) = \xi(v)$ , then  $X(u, \cdot) = X(v, \cdot)$ .

# Role of function $\xi$

Remind that  $X(u, \cdot) - \int_0^t \left( \xi(u) - \frac{1}{m(u,s)} \int_{\pi(u,s)} \xi(r) dr \right) ds$  is a continuous martingale, where  $\pi(u, t) = \{v : X(u, t) = X(v, t)\}$  and  $\xi \uparrow$ .

- If  $\xi = 0$ , then particles coalesce.
- If  $\xi$  is constant on  $\pi(u, t)$ , then the particle  $u$  has no drift.
- If  $\xi(u) = \xi(v)$ , then particles  $u$  and  $v$  coalesce after the meeting: because the drifts of  $X(u, \cdot)$  and  $X(v, \cdot)$  at time  $s$  are equal after the meeting

$$\xi(u) - \frac{1}{m(u, s)} \int_{\pi(u, s)} \xi(u) du = \xi(v) - \frac{1}{m(v, s)} \int_{\pi(v, s)} \xi(r) dr,$$

since  $\pi(u, s) = \pi(v, s)$  for  $X(u, s) = X(v, s)$ .

$\rightsquigarrow$  If  $g(u) = g(v)$ ,  $\xi(u) = \xi(v)$ , then  $X(u, \cdot) = X(v, \cdot)$ .

$\rightsquigarrow$  If  $g = \sum_{i=1}^n x_i \mathbb{I}_{\pi_i}$ ,  $\xi = \sum_{i=1}^n \xi_i \mathbb{I}_{\pi_i}$ , then

$$X(u, t) = \sum_{i=1}^n x_i(t) \mathbb{I}_{\pi_i}(u).$$

Role of  $\xi(u)$ Rem  
ma

$$g(u) = 0, \quad \xi(u) = u, \quad u \in (0, 1)$$

The model is similar to the Howitt-Warren flow. The main difference is that in our case particles change the diffusion rate.

(Howitt, Warren '09; Schertzer, Sun, Swart '14)

# Existence of the particle system

## Theorem

Let  $g, \xi : [0, 1] \rightarrow \mathbb{R}$  be non-decreasing  $\frac{1}{2}$ -Hölder continuous functions. Then there exists a random càdlàg map  $[0, 1] \ni u \mapsto X(u, \cdot) \in C[0, \infty)$  such that

- 1  $X(u, 0) = g(u)$
- 2  $X(u, \cdot) - \int_0^t \left( \xi(u) - \frac{1}{m(u, s)} \int_{\pi(u, s)} \xi(r) dr \right) ds$  is a continuous martingale, where  $\pi(u, t) = \{v : X(u, t) = X(v, t)\}$ ,  $m(u, s) = \text{Leb}\{w : X(w, t) = X(u, t)\}$ ;
- 3  $X(u, t) \leq X(v, t)$ ,  $u < v$ ;
- 4  $\langle X(u, \cdot), X(v, \cdot) \rangle_t = \int_0^t \frac{\mathbb{1}_{\{X(u, s) = X(v, s)\}}}{m(u, s)} ds$ .

- Since  $t \mapsto \|\text{pr}_{X_t}\|_{HS}$  is lower semi-continuous,  $\{t : \|\text{pr}_{X_t}\|_{HS}^2 \leq n\}$  is closed.
- By the Baire category theorem,  $(a_1, b_1) \subset [a, b], \exists n \geq 1$  such that

$$N(t) = \|\text{pr}_{X_t}\|_{HS}^2 \leq n, \quad \forall t \in (a_1, b_1), \quad \text{w.p.p.}$$
