Table of Contents

Motivation and derivation of the SPDE

• Having a large sets of data $\{(\theta_i, \gamma_i), i \in I\}$, one needs to find a function $f: \Theta \to \mathbb{R}$ such that $f(\theta_i) = \gamma_i$.

- Having a large sets of data $\{(\theta_i, \gamma_i), i \in I\}$, one needs to find a function $f: \Theta \to \mathbb{R}$ such that $f(\theta_i) = \gamma_i$.
- Usually one approximates f by

$$f_n(\theta) = \frac{1}{n} \sum_{k=1}^n U(\theta, x_k),$$

where $x_k \in \mathbb{R}^d$, $k \in \{1, ..., n\}$, are parameters which have to be found. Example: $U(\theta, x) = c \cdot h(a \cdot \theta + b), \quad x = (a, b, c)$

イロト イポト イヨト イヨ

- Having a large sets of data $\{(\theta_i, \gamma_i), i \in I\}$, one needs to find a function $f: \Theta \to \mathbb{R}$ such that $f(\theta_i) = \gamma_i$.
- Usually one approximates f by

$$f_n(\theta) = \frac{1}{n} \sum_{k=1}^n U(\theta, x_k),$$

where $x_k \in \mathbb{R}^d$, $k \in \{1, ..., n\}$, are parameters which have to be found. Example: $U(\theta, x) = c \cdot h(a \cdot \theta + b), \quad x = (a, b, c)$

• We measure the distance between f and f_n by the loss function

$$\mathcal{L}[f_n] = \frac{1}{2} \int_{\Theta} |f(\theta) - f_n(\theta)|^2 \mathrm{m}(d\theta),$$

where m is a distribution on the date set Θ .

- Having a large sets of data $\{(\theta_i, \gamma_i), i \in I\}$, one needs to find a function $f: \Theta \to \mathbb{R}$ such that $f(\theta_i) = \gamma_i$.
- Usually one approximates f by

$$f_n(\theta) = \frac{1}{n} \sum_{k=1}^n U(\theta, x_k),$$

where $x_k \in \mathbb{R}^d$, $k \in \{1, ..., n\}$, are parameters which have to be found. Example: $U(\theta, x) = c \cdot h(a \cdot \theta + b), \quad x = (a, b, c)$

• We measure the distance between f and f_n by the loss function

$$\mathcal{L}[f_n] = \frac{1}{2} \int_{\Theta} |f(\theta) - f_n(\theta)|^2 \mathrm{m}(d\theta) = \frac{1}{2} \frac{1}{|I|} \sum_{i \in I} |\gamma_i - f_n(\theta_i)|^2,$$

where ${\bf m}$ is a distribution on the date set $\Theta.$

• Goal: find parameters x_k , $k \in \{1, \ldots, n\}$, which minimize

$$\mathcal{L}[f_n] = \frac{1}{2} \int_{\Theta} |f(\theta) - f_n(\theta)|^2 \mathrm{m}(d\theta)$$
$$= C_f - \frac{1}{n} \sum_{k=1}^n F(x_k) + \frac{1}{2n^2} \sum_{k,l=1}^n K(x_k, x_l)$$

for $F(x) = \mathbb{E}_{\mathrm{m}}[f(\theta)U(\theta, x)]$, $K(x, y) = \mathbb{E}_{\mathrm{m}}[U(\theta, x)U(\theta, y)]$.

 $^{1}\langle\psi,\mu_{t}\rangle=\int_{\mathbb{R}^{d}}\psi(x)\mu_{t}(dx)$

• Goal: find parameters x_k , $k \in \{1, \ldots, n\}$, which minimize

$$\mathcal{L}[f_n] = \frac{1}{2} \int_{\Theta} |f(\theta) - f_n(\theta)|^2 \mathrm{m}(d\theta)$$
$$= C_f - \frac{1}{n} \sum_{k=1}^n F(x_k) + \frac{1}{2n^2} \sum_{k,l=1}^n K(x_k, x_l)$$

for $F(x) = \mathbb{E}_{\mathrm{m}}[f(\theta)U(\theta, x)], \ K(x, y) = \mathbb{E}_{\mathrm{m}}[U(\theta, x)U(\theta, y)].$

• We can define the parameters using the gradient descent:

$$\hat{x}(t_{i+1}) = \hat{x}(t_i) - \Delta t \nabla \mathcal{L}(\hat{x}(t_i)),$$

where Δt is called a **learning rate** and $t_i = i\Delta t$.

 $^{1}\langle\psi,\mu_{t}\rangle=\int_{\mathbb{D}^{d}}\psi(x)\mu_{t}(dx)$

• Goal: find parameters x_k , $k \in \{1, \ldots, n\}$, which minimize

$$\mathcal{L}[f_n] = \frac{1}{2} \int_{\Theta} |f(\theta) - f_n(\theta)|^2 \mathrm{m}(d\theta)$$
$$= C_f - \frac{1}{n} \sum_{k=1}^n F(x_k) + \frac{1}{2n^2} \sum_{k,l=1}^n K(x_k, x_l)$$

for $F(x) = \mathbb{E}_{m}[f(\theta)U(\theta, x)]$, $K(x, y) = \mathbb{E}_{m}[U(\theta, x)U(\theta, y)]$.

• We can define the parameters using the gradient descent:

$$\hat{x}_k(t_{i+1}) = \hat{x}_k(t_i) + \left(\nabla F(\hat{x}_k(t_i)) - \frac{1}{n} \sum_{l=1}^n \nabla_x K(\hat{x}_k(t_i), \hat{x}_l(t_i))\right) \Delta t,$$

where Δt is called a **learning rate** and $t_i = i\Delta t$

 $^{1}\langle\psi,\mu_{t}
angle=\int_{\mathbb{R}^{d}}\psi(x)\mu_{t}(dx)$

• Goal: find parameters x_k , $k \in \{1, \ldots, n\}$, which minimize

$$\mathcal{L}[f_n] = \frac{1}{2} \int_{\Theta} |f(\theta) - f_n(\theta)|^2 \mathrm{m}(d\theta)$$
$$= C_f - \frac{1}{n} \sum_{k=1}^n F(x_k) + \frac{1}{2n^2} \sum_{k,l=1}^n K(x_k, x_l)$$

for $F(x) = \mathbb{E}_{\mathrm{m}}[f(\theta)U(\theta, x)], \ K(x, y) = \mathbb{E}_{\mathrm{m}}[U(\theta, x)U(\theta, y)].$

• We can define the parameters using the gradient descent:

 $\hat{x}_k(t_{i+1}) = \hat{x}_k(t_i) + \left(\nabla F(\hat{x}_k(t_i)) - \langle \nabla_x K(\hat{x}_k(t_i), \cdot), \hat{\mu}_{t_i}^n \rangle\right) \Delta t,$

where Δt is called a **learning rate** and $t_i = i\Delta t$, $\hat{\mu}_t^n = \frac{1}{n} \sum_{l=1}^n \delta_{\hat{x}_l(t)}$

 $^{1}\langle\psi,\mu_{t}
angle=\int_{\mathbb{R}^{d}}\psi(x)\mu_{t}(dx)$

• Goal: find parameters x_k , $k \in \{1, \ldots, n\}$, which minimize

$$\mathcal{C}[f_n] = \frac{1}{2} \int_{\Theta} |f(\theta) - f_n(\theta)|^2 \mathrm{m}(d\theta)$$
$$= C_f - \frac{1}{n} \sum_{k=1}^n F(x_k) + \frac{1}{2n^2} \sum_{k,l=1}^n K(x_k, x_l)$$

for $F(x) = \mathbb{E}_{\mathrm{m}}[f(\theta)U(\theta, x)]$, $K(x, y) = \mathbb{E}_{\mathrm{m}}[U(\theta, x)U(\theta, y)]$.

• We can define the parameters using the stochastic gradient descent:

 $\hat{x}_k(t_{i+1}) = \hat{x}_k(t_i) + \left(\nabla F_i(\hat{x}_k(t_i)) - \langle \nabla_x K_i(\hat{x}_k(t_i), \cdot), \hat{\mu}_{t_i}^n \rangle\right) \Delta t,$

where Δt is called a **learning rate** and $t_i = i\Delta t$, $\hat{\mu}_t^n = \frac{1}{n} \sum_{l=1}^n \delta_{\hat{x}_l(t)}$ $F_i(x) = f(\theta_i)U(\theta_i, x)$ and $K_i(x, y) = U(\theta_i, x)U(\theta_i, y)$ and $\{\theta_i, i \in \mathbb{N}\}$ are iid with distribution m.

 $^{1}\langle\psi,\mu_{t}
angle=\int_{\mathbb{R}^{d}}\psi(x)\mu_{t}(dx)$

SDE for SGD

For
$$R_i^k(\vec{x}) = \nabla F_i(x_k) - \langle \nabla_x K_i(\hat{x}_k, \cdot), \hat{\mu}^n \rangle$$

 $\hat{x}_k(t_{i+1}) = \hat{x}_k(t_i) + R_i^k(\hat{x}(t_i))\Delta t$
 $= \hat{x}_k(t_i) + \mathbb{E}_m R_i^k(\hat{x}(t_i))\Delta t + \sqrt{\Delta t} \left(R_i^k(\hat{x}(t_i)) - \mathbb{E}_m R_i^k(\hat{x}(t_i)) \right) \sqrt{\Delta t}$

is the Euler-Maruyama scheme for the SDE

 $dx_k(t) = [\nabla F(x_k(t)) - \langle \nabla_x K(x_k(t), \cdot), \mu_t^n \rangle] dt + \sqrt{\Delta t} dB_k(t)$

 $d[B_k, B_l]_t = \operatorname{Cov}\left(R_i^k, R_i^l\right) dt = \tilde{A}(x_k(t), x_l(t), \mu_t^n) dt,$

where $\mu_t^n = \frac{1}{n} \sum_{i=1}^n \delta_{x_i(t)}, \ k, l \in \{1, ..., n\}.$

Equation for empirical measure μ_t^n

We came to the SDE

 $dx_k(t) = V(x_k(t), \mu_t^n) dt + \sqrt{\alpha} dB_k(t)$ $d[B_k, B_l]_t = \tilde{A}(x_k(t), x_l(t), \mu_t^n) dt,$

where $\mu_t^n = \frac{1}{n} \sum_{l=1}^n \delta_{x_l(t)}$, $\tilde{A}(x, y, \mu) = (\mathbb{E}_m G_k(x, \mu, \theta) G_l(y, \mu, \theta))_{i,j \in [d]}$ and $\alpha = \Delta t$ is the learning rate.

< □ > < 向

Equation for empirical measure μ_t^n

We came to the SDE

 $dx_k(t) = V(x_k(t), \mu_t^n) dt + \sqrt{\alpha} dB_k(t)$ $d[B_k, B_l]_t = \tilde{A}(x_k(t), x_l(t), \mu_t^n) dt,$

where $\mu_t^n = \frac{1}{n} \sum_{l=1}^n \delta_{x_l(t)}$, $\tilde{A}(x, y, \mu) = (\mathbb{E}_m G_k(x, \mu, \theta) G_l(y, \mu, \theta))_{i,j \in [d]}$ and $\alpha = \Delta t$ is the learning rate.

Taking $\varphi \in \mathcal{C}^2_c(\mathbb{R}^d)$, we get for the empirical measure μ^n_t

$$\langle \varphi, \mu_t^n \rangle = \langle \varphi, \mu_0^n \rangle + \frac{\alpha}{2} \int_0^t \left\langle \nabla^2 \varphi : A(\cdot, \mu_s^n), \mu_s^n \right\rangle ds + \int_0^t \left\langle \nabla \varphi \cdot V(\cdot, \mu_s^n), \mu_s^n \right\rangle ds$$

+ Martingale,

where $A(x, \mu) = \tilde{A}(x, x, \mu)$

Equation for empirical measure μ_t^n

We came to the SDE

 $dx_k(t) = V(x_k(t), \mu_t^n) dt + \sqrt{\alpha} dB_k(t)$ $d[B_k, B_l]_t = \tilde{A}(x_k(t), x_l(t), \mu_t^n) dt,$

where $\mu_t^n = \frac{1}{n} \sum_{l=1}^n \delta_{x_l(t)}$, $\tilde{A}(x, y, \mu) = (\mathbb{E}_m G_k(x, \mu, \theta) G_l(y, \mu, \theta))_{i,j \in [d]}$ and $\alpha = \Delta t$ is the learning rate.

Taking $\varphi \in \mathcal{C}^2_c(\mathbb{R}^d)$, we get for the empirical measure μ^n_t

$$\langle \varphi, \mu_t^n \rangle = \langle \varphi, \mu_0^n \rangle + \frac{\alpha}{2} \int_0^t \left\langle \nabla^2 \varphi : A(\cdot, \mu_s^n), \mu_s^n \right\rangle ds + \int_0^t \left\langle \nabla \varphi \cdot V(\cdot, \mu_s^n), \mu_s^n \right\rangle ds$$

+ Martingale,

where $A(x,\mu) = \tilde{A}(x,x,\mu)$ and $[Martingale]_t = \alpha \int_0^t \int_{\mathbb{R}^d} \int_{\mathbb{R}^d} (\nabla \varphi(x) \otimes \nabla \varphi(y)) : \tilde{A}(x,y,\mu_s^n) \mu_s^n(dx) \mu_s^n(dy) ds$

Equation for empirical measure μ_{t}^{n}

We came to the SDE

 $dx_k(t) = V(x_k(t), \mu_t^n) dt + \sqrt{\alpha} dB_k(t)$ $d[B_k, B_l]_t = \tilde{A}(x_k(t), x_l(t), \mu_t^n) dt,$

where $\mu_t^n = \frac{1}{n} \sum_{l=1}^n \delta_{x_l(t)}$, $\tilde{A}(x, y, \mu) = (\mathbb{E}_m G_k(x, \mu, \theta) G_l(y, \mu, \theta))_{i, i \in [d]}$ and $\alpha = \Delta t$ is the learning rate.

Taking $\varphi \in \mathcal{C}^2_c(\mathbb{R}^d)$, we get for the empirical measure μ^n_t

$$\langle \varphi, \mu_t^n \rangle = \langle \varphi, \mu_0^n \rangle + \frac{\alpha}{2} \int_0^t \left\langle \nabla^2 \varphi : A(\cdot, \mu_s^n), \mu_s^n \right\rangle ds + \int_0^t \left\langle \nabla \varphi \cdot V(\cdot, \mu_s^n), \mu_s^n \right\rangle ds$$

+ Martingale.

where $A(x, \mu) = \tilde{A}(x, x, \mu)$ and

 $\left[\mathsf{Martingale}\right]_t = \alpha \int_0^t \int_{\mathbb{T}^d} \int_{\mathbb{T}^d} \left(\nabla \varphi(x) \otimes \nabla \varphi(y) \right) : \tilde{A}(x, y, \mu_s^n) \mu_s^n(dx) \mu_s^n(dy) ds$

Note that $f_n(\theta) = \frac{1}{n} \sum_{k=1}^n U(\theta, x_k(t)) = \int_{\mathbb{R}^d} U(\theta, x) \mu_t^n(dx)$ should approximate the true function f for large t. 6/25

Overparametrised limit $(n \rightarrow \infty)$

Assuming that the number of parameters $n \to \infty$ and $x_i(0) \sim \mu_0$ are i.i.d., the limit $\mu_t = \lim_{n \to \infty} \mu_t^n$ solves the SPDE: $\forall \varphi \in \mathcal{C}^2_c(\mathbb{R}^d)$

$$\begin{split} \langle \varphi, \mu_t \rangle &= \langle \varphi, \mu_0 \rangle + \frac{\alpha}{2} \int_0^t \left\langle \nabla^2 \varphi : \mathcal{A}(\cdot, \mu_s), \mu_s \right\rangle ds + \int_0^t \left\langle \nabla \varphi \cdot \mathcal{V}(\cdot, \mu_s), \mu_s \right\rangle ds \\ &+ \mathcal{M}_{\varphi}(t), \end{split}$$

$$[M_{\varphi}]_{t} = \alpha \int_{0}^{t} \int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}} (\nabla \varphi(x) \otimes \nabla \varphi(y)) : \tilde{A}(x, y, \mu_{s}) \mu_{s}(dx) \mu_{s}(dy) ds$$

where $\tilde{A}(x, y, \mu) = (\mathbb{E}_{m} G_{k}(x, \mu, \theta) G_{l}(y, \mu, \theta))_{k, l \in [d]}$ and $A(x, \mu) = \tilde{A}(x, x, \mu).$

For more details regarding derivation of the martingale problem above see [Rotskoff, Vanden-Eijnden *Trainability and accuracy off neural networks: an interacting particle system approach* (to appear in CPAM)]

イロト イポト イヨト イヨト

Stochastic mean-field equation

We will assume the noise of equation has a special structure: we will take a cylindrical Wiener process W on $L_2(\Theta, m)$ and assume

$$M_{\varphi}(t) = \sqrt{lpha} \int_{0}^{t} \int_{\Theta} \langle
abla arphi \cdot G(\cdot, \mu_{s}, heta), \mu_{s}
angle W(d heta, ds)$$

Stochastic mean-field equation

We will assume the noise of equation has a special structure: we will take a cylindrical Wiener process W on $L_2(\Theta, m)$ and assume

$$M_{\varphi}(t) = \sqrt{\alpha} \int_{0}^{t} \int_{\Theta} \langle \nabla \varphi \cdot G(\cdot, \mu_{s}, \theta), \mu_{s} \rangle W(d\theta, ds)$$

then

$$\begin{split} \left[M_{\varphi}\right]_{t} &= \alpha \int_{0}^{t} \int_{\Theta} \left\langle \nabla \varphi \cdot G(\cdot, \mu_{s}, \theta), \mu_{s} \right\rangle \left\langle \nabla \varphi \cdot G(\cdot, \mu_{s}, \theta), \mu_{s} \right\rangle \mathrm{m}(d\theta) ds \\ &= \int_{0}^{t} \int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}} \left(\nabla \varphi(x) \otimes \nabla \varphi(y) \right) : \tilde{A}(x, y, \mu_{s}) \mu_{s}(dx) \mu_{s}(dy) ds \end{split}$$

Stochastic mean-field equation

We will assume the noise of equation has a special structure: we will take a cylindrical Wiener process W on $L_2(\Theta, m)$ and assume

$$M_{\varphi}(t) = \sqrt{\alpha} \int_{0}^{t} \int_{\Theta} \langle \nabla \varphi \cdot G(\cdot, \mu_{s}, \theta), \mu_{s} \rangle W(d\theta, ds)$$

then

$$\begin{split} \left[M_{\varphi}\right]_{t} &= \alpha \int_{0}^{t} \int_{\Theta} \left\langle \nabla \varphi \cdot G(\cdot, \mu_{s}, \theta), \mu_{s} \right\rangle \left\langle \nabla \varphi \cdot G(\cdot, \mu_{s}, \theta), \mu_{s} \right\rangle \operatorname{m}(d\theta) ds \\ &= \int_{0}^{t} \int_{\mathbb{R}^{d}} \int_{\mathbb{R}^{d}} \left(\nabla \varphi(x) \otimes \nabla \varphi(y) \right) : \tilde{A}(x, y, \mu_{s}) \mu_{s}(dx) \mu_{s}(dy) ds \end{split}$$

We come to the Stochastic Mean-Field Equation (SMFE):

$$d\mu_t = \frac{\alpha}{2} \nabla^2 : (A(\cdot, \mu_t)\mu_t) dt - \nabla \cdot (V(\cdot, \mu_t)\mu_t) dt + \sqrt{\alpha} \nabla \cdot \int_{\Theta} G(\cdot, \mu_t, \theta) W(d\theta, dt)$$

8/25

Table of Contents

imiting behaviour of solutions to SMFE

• • • • • • • • • •

$$d\mu_t = \frac{1}{2}\nabla^2 : (A(\cdot,\mu_t)\mu_t) dt - \nabla \cdot (V(\cdot,\mu_t)\mu_t) dt - \nabla \cdot \int_{\Theta} (G(\cdot,\mu_t,\theta)\mu_t) W(d\theta,dt),$$

SDE with interaction

The SMFE has a connection with the SDE with interaction (Kotelenez '95)

$$egin{aligned} dX(u,t) &= V(X(u,t),ar{\mu}_t)dt + \int_{\Theta} G(X(u,t),ar{\mu}_t, heta)W(d heta,dt),\ X(u,0) &= u, \quad ar{\mu}_t &= \mu_0 \circ X^{-1}(\cdot,t), \quad u \in \mathbb{R}^d, \ t \geq 0. \end{aligned}$$

(ロ) (四) (三) (三)

SDE with interaction

The SMFE has a connection with the SDE with interaction (Kotelenez '95)

$$egin{aligned} dX(u,t) &= V(X(u,t),ar{\mu}_t)dt + \int_{\Theta} G(X(u,t),ar{\mu}_t, heta)W(d heta,dt),\ X(u,0) &= u, \quad ar{\mu}_t &= \mu_0 \circ X^{-1}(\cdot,t), \quad u \in \mathbb{R}^d, \quad t \geq 0. \end{aligned}$$

Theorem (Dorogovtsev' 07)

Let V, G be Lipschitz continuous, i.e. $\exists L > 0$ such that a.s.

 $\left\|V(x,\mu)-V(y,\nu)\right\|+\left\|\left\|G(x,\mu,\cdot)-G(y,\nu,\cdot)\right\|\right\|_{\mathrm{m}}\leq L\left(|x-y|+\mathcal{W}_{2}(\mu,\nu)\right).$

Then for every $\mu_0 \in \mathcal{P}_2(\mathbb{R}^d)$ the SDE with interaction has a unique solution started from μ_0 .

• • • • • • • • • • • •

SMFE and SDE with interaction

Lemma

Let X be a solution to the SDE with interaction with $\mu_0 \in \mathcal{P}_2(\mathbb{R}^d)$. Then $\overline{\mu}_t = \mu_0 \circ X^{-1}(\cdot, t)$, $t \ge 0$, is a solution to the SMFE.

• • • • • • • • • •

SMFE and SDE with interaction

Lemma

Let X be a solution to the SDE with interaction with $\mu_0 \in \mathcal{P}_2(\mathbb{R}^d)$. Then $\overline{\mu}_t = \mu_0 \circ X^{-1}(\cdot, t)$, $t \ge 0$, is a solution to the SMFE.

Definition: We will say that $\bar{\mu}_t$, $t \ge 0$, is a superposition solution to the stochastic mean-field equation.

(日) (日) (日) (日) (日)

SMFE and SDE with interaction

Lemma

Let X be a solution to the SDE with interaction with $\mu_0 \in \mathcal{P}_2(\mathbb{R}^d)$. Then $\overline{\mu}_t = \mu_0 \circ X^{-1}(\cdot, t)$, $t \ge 0$, is a solution to the SMFE.

Definition: We will say that $\bar{\mu}_t$, $t \ge 0$, is a superposition solution to the stochastic mean-field equation.

Corollary

Let *V*, *G* be Lipschitz continuous. Then the SMFE $d\mu_t = \frac{1}{2}\nabla^2 : (A(\cdot, \mu_t)\mu_t) dt - \nabla \cdot (V(\cdot, \mu_t)\mu_t) dt - \nabla \cdot \int_{\Theta} G(\cdot, \mu_t, \theta)\mu_t W(d\theta, dt)$

has a unique solution iff it has **only** superposition solutions.

イロト イポト イヨト イヨト

Uniqueness of solutions to SMFE

• To prove the uniqueness, we show that every solution to the (nonlinear) SMFE is a superposition solution.

Uniqueness of solutions to SMFE

- To prove the uniqueness, we show that every solution to the (nonlinear) SMFE is a superposition solution.
- We first freeze the solution μ_t in the coefficients, considering the linear SPDE:

$$d
u_t = rac{1}{2}
abla^2 : (a(t,\cdot)
u_t) dt -
abla \cdot (v(t,\cdot)
u_t) dt \ -
abla \cdot \int_{\Theta} g(t,\cdot, heta)
u_t W(d heta,dt),$$

where $a(t,x) = A(x,\mu_t)$, $v(t,x) = V(x,\mu_t)$ and $g(t,x,\theta) = G(x,\mu_t,\theta)$.

Uniqueness of solutions to SMFE

- To prove the uniqueness, we show that every solution to the (nonlinear) SMFE is a superposition solution.
- We first freeze the solution μ_t in the coefficients, considering the linear SPDE:

$$egin{aligned} d
u_t &= rac{1}{2}
abla^2 : (egin{aligned} a(t,\cdot)
u_t) \, dt -
abla \cdot (v(t,\cdot)
u_t) \, dt \ &-
abla \cdot \int_{\Theta} g(t,\cdot, heta)
u_t W(d heta,dt), \end{aligned}$$

where $a(t,x) = A(x,\mu_t)$, $v(t,x) = V(x,\mu_t)$ and $g(t,x,\theta) = G(x,\mu_t,\theta)$.

• We remove the second order term and the noise term from the linear SPDE by a (random) transformation of the space.

Random transformation of the space

We introduce the field of martingales

$$M(x,t) = \int_0^t g(s,x,\theta) W(d\theta,ds), \quad x \in \mathbb{R}^d, \ t \ge 0$$

and consider a solution $\psi_t(x) = (\psi_t^1(x), \dots, \psi_t^d(x))$ to the stochastic transport equation

$$\psi_t^k(x) = x^k - \int_0^t \nabla \psi_s^k(x) \cdot M(x, \circ ds), \quad t \ge 0, \ x \in \mathbb{R}^d, \ k \in \{1, \dots, d\}.$$

Random transformation of the space

We introduce the field of martingales

$$M(x,t) = \int_0^t g(s,x, heta) W(d heta,ds), \quad x \in \mathbb{R}^d, \ t \ge 0$$

and consider a solution $\psi_t(x) = (\psi_t^1(x), \dots, \psi_t^d(x))$ to the stochastic transport equation

$$\psi_t^k(x) = x^k - \int_0^t \nabla \psi_s^k(x) \cdot M(x, \circ ds), \quad t \ge 0, \ x \in \mathbb{R}^d, \ k \in \{1, \ldots, d\}.$$

Lemma (see Kunita Stochastic flows and SDEs)

Under some smooth assumption on the coefficient g, the exists a field of diffeomorphisms $\psi(t, \cdot) : \mathbb{R}^d \to \mathbb{R}^d$, $t \ge 0$, which solves the stochastic transport equation.

Vitalii Konarovskyi (Bielefeld University)

• • • • • • • • • • • • •

Transformation of space

For the solution ν_t , $t \ge 0$, to the linear SPDE

$$d\nu_t = \frac{1}{2}\nabla^2 : (a(t,\cdot)\nu_t) dt - \nabla \cdot (v(t,\cdot)\nu_t) dt - \nabla \cdot \int_{\Theta} g(t,\cdot,\theta)\nu_t W(d\theta,dt),$$

we define

$$\rho_t = \nu_t \circ \psi_t^{-1}, \quad t \ge 0$$

(ロ) (四) (三) (三)

Transformation of space

For the solution ν_t , $t \ge 0$, to the linear SPDE

$$d\nu_t = \frac{1}{2}\nabla^2 : (a(t,\cdot)\nu_t) dt - \nabla \cdot (v(t,\cdot)\nu_t) dt - \nabla \cdot \int_{\Theta} g(t,\cdot,\theta)\nu_t W(d\theta,dt),$$

we define

1

$$\rho_t = \nu_t \circ \psi_t^{-1}, \quad t \ge 0$$

Proposition

Let the coefficient g be smooth enough. Then ρ_t , $t \ge 0$, is a solution to the continuity equation^a

$$d
ho_t = -
abla(b(t,\cdot)
ho_t)dt, \quad
ho_0 =
u_0 = \mu_0,$$

for some **b** depending on v and derivatives of a and ψ .

イロト イヨト イヨト イヨト

Well-posedness of SMFE

Theorem (Gess, Gvalani, K. 2022)

Let the coefficients V, G be Lipschitz continuous and smooth enough w.r.t. spetial variable. Then the SMFE

$$d\mu_t = \frac{1}{2}\nabla^2 : (A(\cdot,\mu_t)\mu_t) dt - \nabla \cdot (V(\cdot,\mu_t)\mu_t) dt - \nabla \cdot \int_{\Theta} G(\cdot,\mu_t,\theta)\mu_t W(d\theta,dt)$$

has a unique solution. Moreover, μ_t is a superposition solution, i.e.,

 $\mu_t = \mu_0 \circ X^{-1}(\cdot, t), \quad t \ge 0,$

where X solves

$$dX(u,t) = V(X(u,t),\mu_t)dt + \int_{\Theta} G(X(u,t),\mu_t, heta)W(d heta,dt), \quad X(u,0) = u.$$

Imiting behaviour of solutions to SMFE

Convergence of the empirical measure

Theorem (Gess, Gvalani, K. 2022) Let $\mu^{n,\alpha}$ and μ^{α} be superposition solutions to the SMFE $d\mu_t = \frac{\alpha}{2} \nabla^2 : (A(\cdot,\mu_t)\mu_t) dt - \nabla \cdot (V(\cdot,\mu_t)\mu_t) dt$ $-\sqrt{\alpha} \nabla \cdot \int_{\Omega} G(\cdot,\mu_t,\theta)\mu_t W(d\theta,dt),$

started from $\mu_0^n = \frac{1}{n} \sum_{i=1}^n \delta_{x_i}$ and μ_0 , respectively, where $x_i \sim \mu_0$ are independent. Then

$$\mathbb{E} \sup_{t \in [0,T]} \mathcal{W}_2^2(\mu_t^{n,\alpha},\mu_t^{\alpha}) \leq C \mathbb{E} \mathcal{W}_2^2(\mu_0^n,\mu_0) \leq C' n^{-1},$$

where the constants C, C' are independent of α .

• • • • • • • • • • • •

Idea of the proof

Since $\mu^{n,\alpha}$ and μ^{α} are superposition solutions,

$$\mu^{n,lpha}_t=\mu^n_0\circ X^{-1}_{n,lpha}(\cdot,t), \quad \mu^lpha=\mu_0\circ X^{-1}_lpha(\cdot,t),$$

where $X_{n,\alpha}$ and X_{α} are solutions to

$$dX(u,t) = V(X(u,t),\mu_t)dt + \sqrt{\alpha} \int_{\Theta} G(X(u,t),\mu_t,\theta)W(d\theta,dt), \quad X(u,0) = u.$$

イロト イポト イヨト イヨト

Idea of the proof

Since $\mu^{n,\alpha}$ and μ^{α} are superposition solutions,

$$\mu^{n,lpha}_t=\mu^n_0\circ X^{-1}_{n,lpha}(\cdot,t), \quad \mu^lpha=\mu_0\circ X^{-1}_lpha(\cdot,t),$$

where $X_{n,\alpha}$ and X_{α} are solutions to

$$dX(u,t) = V(X(u,t),\mu_t)dt + \sqrt{\alpha} \int_{\Theta} G(X(u,t),\mu_t,\theta)W(d\theta,dt), \quad X(u,0) = u.$$

Hence, for any χ with marginals μ_0^n and $\mu_0,$ we get

$$\begin{split} \mathbb{E}\sup_{s\in[0,t]}\mathcal{W}_{2}^{2}(\mu_{s}^{n,\alpha},\mu_{s}^{\alpha}) &\leq \mathbb{E}\sup_{s\in[0,t]}\int_{\mathbb{R}^{2d}}|X_{n,\alpha}(u,s)-X_{\alpha}(v,s)|^{2}\chi(du,dv)\\ &\leq C\int_{\mathbb{R}^{2d}}|u-v|^{2}\chi(du,dv)+C\int_{0}^{t}\mathbb{E}\mathcal{W}_{2}^{2}(\mu_{s}^{n,\alpha},\mu_{s}^{\alpha})ds. \end{split}$$

• • • • • • • • • •

imiting behaviour of solutions to SMFE

Law of large numbers behavior for $\alpha \rightarrow 0$

Theorem (Gess, Gvalani, K. 2022)
If
$$\mu^{\alpha}$$
 is a superposition solution to
 $d\mu_t = \frac{\alpha}{2} \nabla^2 : (A(\cdot, \mu_t)\mu_t) dt - \nabla \cdot (V(\cdot, \mu_t)\mu_t) dt - \sqrt{\alpha} \nabla \cdot \int_{\Theta} G(\cdot, \mu_t, \theta)\mu_t W(d\theta, dt)$
and $d\mu_t^0 = -\nabla \cdot (V(\cdot, \mu_t^0)\mu_t^0) dt$. Then
 $\mathbb{E} \sup_{t \in [0, T]} \mathcal{W}_2^2(\mu_t^{\alpha}, \mu_t^0) \leq C\alpha.$

Law of large numbers behavior for $\alpha \rightarrow 0$

Theorem (Gess, Gvalani, K. 2022)
If
$$\mu^{\alpha}$$
 is a superposition solution to
 $d\mu_t = \frac{\alpha}{2} \nabla^2 : (A(\cdot, \mu_t)\mu_t) dt - \nabla \cdot (V(\cdot, \mu_t)\mu_t) dt - \sqrt{\alpha} \nabla \cdot \int_{\Theta} G(\cdot, \mu_t, \theta)\mu_t W(d\theta, dt)$
and $d\mu_t^0 = -\nabla \cdot (V(\cdot, \mu_t^0)\mu_t^0) dt$. Then
 $\mathbb{E} \sup_{t \in [0, T]} \mathcal{W}_2^2(\mu_t^{\alpha}, \mu_t^0) \leq C\alpha.$

$$\mathbb{E}\sup_{t\in[0,T]}\mathcal{W}_2^2(\mu_t^{n,\frac{1}{n}},\mu_t^0)\leq Cn^{-1}$$

or formally

Quantified central limit theorem for SMFE

Since $\mu_t^{n,\frac{1}{n}} = \frac{1}{n} \sum_{i=1}^n \delta_{x_i(t)} = \mu_t^0 + O(n^{-1/2})$, we consider $\eta_t^n = \sqrt{n} \left(\mu^{n,\frac{1}{n}} - \mu^0 \right)$.

Theorem (Gess, Gvalani, K. 2022)

There exists the Gaussian fluctuation field $\eta,$ which is a solution to the linear SPDE

$$egin{aligned} d\eta_t &= -
abla \cdot \left(V(\cdot,\mu^0_t)\eta_t + \langle ilde{V}(x,\cdot),\eta_t
angle \mu^0_t(dx)
ight) dt \ &-
abla \cdot \int_{\Theta} G(\cdot,\mu^0_t, heta) \mu^0_t W(d heta,dt) \end{aligned}$$

Moreover,

$$\mathbb{E}\sup_{t\in[0,T]}\|\eta_t^n-\eta_t\|_{H^{-J}}^2\leq Cn^{-1}.$$

The quantified CLT gives us that

$$\mu_t^{n,\frac{1}{n}} = \frac{1}{n} \sum_{i=1}^n \delta_{x_i(t)} = \mu_t^0 + n^{-1/2} \eta + O(n^{-1}).$$

The quantified CLT gives us that

$$\mu_t^{n,\frac{1}{n}} = \frac{1}{n} \sum_{i=1}^n \delta_{x_i(t)} = \mu_t^0 + n^{-1/2} \eta + O(n^{-1}).$$

On the other hand, the empirical distribution of SGD with *n* parameters and learning rate $\alpha = \frac{1}{n}$ satisfies³

$$\nu_t^{n,\frac{1}{n}} = \frac{1}{n} \sum_{i=1}^n \delta_{\hat{x}_i(\lfloor nt \rfloor)} = \mu_t^0 + n^{-1/2} \eta + o(n^{-1/2})$$

³see Sirignano, Spiliopoulos '20

The quantified CLT gives us that

$$\mu_t^{n,\frac{1}{n}} = \frac{1}{n} \sum_{i=1}^n \delta_{x_i(t)} = \mu_t^0 + n^{-1/2} \eta + O(n^{-1}).$$

On the other hand, the empirical distribution of SGD with *n* parameters and learning rate $\alpha = \frac{1}{n}$ satisfies³

$$\nu_t^{n,\frac{1}{n}} = \frac{1}{n} \sum_{i=1}^n \delta_{\hat{x}_i(\lfloor nt \rfloor)} = \mu_t^0 + n^{-1/2} \eta + o(n^{-1/2})$$

Therefore, $\nu^{n,\frac{1}{n}} - \mu^{n,\frac{1}{n}} = o(n^{-1/2}).$

³see Sirignano, Spiliopoulos '20

Theorem (Gess, Gvalani, K. 2022)

Let $\mu^{n,\frac{1}{n}}$ be a superposition solution to the SMFE with leaning rate $\alpha = \frac{1}{n}$ started from $\frac{1}{n} \sum_{i=1}^{n} \delta_{x_i}$. Let also $\nu^{n,\frac{1}{n}}$ be the empirical process associated to the SGD with $\alpha = \frac{1}{n}$. Then

$$\mathcal{W}_{p}\left(\mathsf{Law}(\mu^{n,rac{1}{n}}),\mathsf{Law}(
u^{n,rac{1}{n}})
ight)=o(n^{-1/2})$$

for all $p \in [0, 2)$.

Conclusion

The **Stochastic Mean-Field Equation** provides a higher order approximation to the SGD dynamics than the approximation by the non-fluctuation limit μ^0 which give the order $O(n^{-1/2})$.
